CTA Code snippet

Replace your entire `installGame()` or any other CTA related function with the following logic. Replace the function wherever they are called.

```
// --- CTA LOGIC ---
      function openPlayableCTA() {
        const cta = window.game_object && window.game_object.Cta;
        if (!cta) return;

        const ua = navigator.userAgent || navigator.vendor || window.opera;
        let url = cta.playStoreLink;

        if (/iPad|iPhone|iPod/.test(ua) && !window.MSStream) {
          url = cta.appStoreLink;
        }

        // Facebook / Meta
        if (window.FbPlayableAd) {
          FbPlayableAd.onCTAClick();
          return;
        }

        // MRAID 2 networks (AppLovin, Unity, ironSource, AdMob, etc.)
        if (window.mraid) {
          try {
            mraid.open(url);
            return;
          } catch (e) {
            console.warn("mraid.open failed", e);
          }
        }

        // Amazon Ads
        if (window.dapi && dapi.openStoreUrl) {
          dapi.openStoreUrl();
          return;
        }

        // Desktop / fallback
        window.open(url, "_blank");
      }

```

Game Object – CTA Validation Checklist

1. CTA Object Presence

- `window.game_object.Cta` **exists**
- `Cta` is an **object**, not `null` or empty

2. Required CTA Keys

- `Cta.playStoreLink` **exists**
- `Cta.appStoreLink` **exists**
- **No usage of deprecated keys**
  - ❌ `appleStoreLink`
  - ❌ `iosLink`

- ❌ `androidLink`

Only these two keys are allowed:

```
playStoreLink
appStoreLink
```

---

3. URL Validity

- `playStoreLink` starts with `https://play.google.com/store/apps/details?id=`
- `appStoreLink` starts with `https://apps.apple.com/`
- URLs are **not empty strings**
- URLs do **not** contain placeholders (`{{ }}` , `TODO` , `example.com`)

4. Platform Safety

- CTA logic **does not hardcode** platform detection outside CTA handler
- CTA handler selects URL **at click time**, not on load
- `mraid.open(url)` is used **only if MRAID exists**
- Fallback to `window.open(url, "_blank")` exists

5. Single Source of Truth

- CTA URLs are read **only from** `window.game_object.Cta`
- No duplicated URLs elsewhere in the HTML or JS
- No network-specific CTA URLs hardcoded in templates

Minimal Valid CTA Example

```
Cta: {
  playStoreLink: "https://play.google.com/store/apps/details?id=com.example.app",
  appStoreLink: "https://apps.apple.com/app/id123456789"
}
```

Common Rejection Reasons

- Using `appleStoreLink`
- Missing one of the two URLs
- Hardcoded CTA URL in JS
- Opening store URL on page load
- Platform detection outside CTA handler

Note: If the above code is implemented, **DO NOT** add the regex `` `/*!{{CTA_DEFINITION}}*/` ``
